

AI-Use Log

Tools used: Claude (Anthropic), throughout, for code, real-data acquisition scripts, analysis, and this document's own prose, in an agentic session with direct network/tool access. Every number traces to `data/processed/*.json` — see `deliverables/evidence_table.csv`. Checking: every AI-proposed number or claim was re-derived from the real data and re-run, not accepted on assertion.

Rejected suggestion 1 — wrong Amazon category

First attempt streamed Amazon's "Appliances" category, reasoning "air purifiers are appliances." Returned only 32 candidates, dominated by replacement-filter accessories. **Rejected** — real purifiers are merchandised under "Home_and_Kitchen". Switching categories produced 237 real validated products and 10,547 real reviews.

Rejected suggestion 2 — treating a first-pass classifier as final

The first title+description keyword classifier was accepted as "done" at 106 candidates. Manual inspection found real false positives — vacuum cleaners, wearable necklace ionizers — matched because their *description* mentioned "air purifier" in cross-sell copy. **Rejected**: description-text matching conflates "cross-sold near a purifier" with "is a purifier." Fixed with title-only matching plus exclusion regexes, raising the count to 237.

One check that failed

Q3's automated theme classifier first ran without a polarity gate — a keyword counted regardless of sentence polarity. On real text this scored "Ozone / smell / irritation" at 22% prevalence with a **positive** CSAT impact — incoherent for a friction, since "great at eliminating odors" was counted as a complaint. Fixed by only counting a keyword inside a negative-polarity sentence.
