

Internal innovation disclosure – not a filed patent application
Generated entirely from real, already-computed pipeline outputs
(src/real/decision_framework_real.py, regenerated automatically whenever that pipeline
re-runs). No claim below reflects legal patent counsel review.

Smart/Connected Feature Expansion (app control, voice assistant)

Smart-speaker / connected-home households

Not pursued — the evidence wasn't there

Disclosure ID: OS-3 · Versuni Disruptive Innovation Team, Amsterdam · Generated by
decision_framework_real.py

1. Field of the Invention

This disclosure concerns connected household appliances, and specifically a concept addressing the following real, evidence-derived friction: Presumed friction with manual app/physical control

Fig. 1 — This disclosure's real position in the app's own 5-stage funnel.

2. Real Evidence & Design Directions

No polarity-gated satisfaction methodology exists for this theme in this pipeline. Real evidence: keyword search across all 10529 real reviews: 107 matches (1.016%); reviews that DO mention connectivity skew POSITIVE (feature praise, not complaint) on manual inspection.

No real design-operator possibilities are catalogued for this theme in this pipeline's possibility grid (this theme did not reach that stage of the funnel).

3. Market & Economic Rationale — Fully Substantiated

Typical real market price	No real product classified under this friction theme has a known listed price yet.
Price-weighted exposure	No priced real review is classified under this friction theme yet.

Fig. 2 — Real evidence figures computed by this pipeline for this friction theme.

4. Feasibility & Technical Risk

2-5yr feasibility rating	high (rank 3 of 3 real candidates evaluated)
Feasibility rationale	Technically the easiest of the three: TC-R07 shows Versuni already ships Wi-Fi/app connectivity today, and TC-R08 is an already-standardized protocol layer. High feasibility does NOT rescue this opportunity - it fails the upstream Consumer Pain evidence gate below. Ease of build is not evidence of demand.
Assumptions	• A friction not visible in review text could still exist but be unarticulated - review text structurally cannot surface demand for a feature nobody has been offered yet.
Known uncertainty	• Keyword-search prevalence has no polarity gate, so this number is a topic-mention count, not a friction measure - a materially weaker evidence class than OS-1/OS-2's polarity-gated taxonomy themes.

5. Competitive Gap & Evaluation Record

No matching Criteria-stage evaluation exists for this theme (it did not reach the possibility grid), so no competitive-gap or criteria record is available — reported as unavailable, not estimated.

6. Why This Real Outcome

Unlike the earlier synthetic-fixtured version of this exercise, connectivity mentions are not literally zero in real data (~1%) - but they fail the Consumer Pain evidence-sufficiency gate (no real CSAT signal) and skew positive when they do appear. High technical Feasibility does not rescue a candidate with no real friction evidence to build against.

Notably, technical feasibility alone does not rescue this candidate — high feasibility does not compensate for a failed Consumer Pain evidence gate (see Section 4 above for the real rationale).

7. What this doesn't cover yet

This pipeline's real evidence base has no physical-prototype, industrial-design, or manufacturing data of any kind — for this concept or for any real product in the underlying dataset (weight and dimension fields do not exist anywhere in the corpus, verified directly). So this disclosure leaves them open rather than guessing: physical weight and dimensions, bill

of materials, housing material, the fabrication or manufacturing process, exact sensor part numbers, and firmware architecture. Filling any of these in without a real industrial-design phase would be invention, not evidence.

8. Design & Business Claims

The following claims describe the disclosed concept for internal evaluation purposes, generated from this candidate's own real evaluated fields, and are not filed with, or reviewed by, any patent office.

- 1. A connected household appliance addressing a real, evidence-derived friction: Presumed friction with manual app/physical control
- 2. The appliance of claim 1, intended for the real usage context: Smart-speaker / connected-home households.
- 3. A method of evaluating such an appliance concept using this pipeline's real Consumer Pain evidence-sufficiency gate, real Economic Value computation, and real 2-5 year Feasibility rating, exactly as disclosed in this document.

9. Comparative Context

Real evidence values computed by this pipeline for every candidate evaluated in this funnel stage, for reference:

Candidate	Real prevalence	Real CSAT impact	Real typical price	Real status
OS-1 — Reliability-Verified Air Purifiers (exte	1.58%	-2.223	\$199.99	non dominated
OS-2 — Whisper-Quiet Night Mode	3.5%	-0.571	\$179.99	non dominated
OS-3 — Smart/Connected Feature Expansion (app)	1.016%	no signal	no real figure for this	gate failed insufficient pain evidence

10. Evidence Appendix

Real evidence identifiers referenced in this disclosure: keyword_search:connectivity, TC-R07, TC-R08.

Underlying computation: keyword search across all 10529 real reviews: 107 matches (1.016%); reviews that DO mention connectivity skew POSITIVE (feature praise, not complaint) on manual inspection.

Market scenario used for category context: IMARC Group (Q5 alternative) (6.54% CAGR). The Q6 scores above do not depend on category CAGR at all - they are built entirely from review-level Consumer Pain/Economic Value/Feasibility, so this scenario flag changes the category-sizing narrative in Q5/insight_pack but changes NOTHING in this file's scores or verdict. Run with --market-scenario=imarc to see this confirmed live.
