

The State of Home Connectivity 2025

A nationwide survey exploring the experiences and expectations of U.S. consumers with their home Wi-Fi networks

Introduction

The home has become the most connected environment in our lives. From laptops and smartphones to cameras, thermostats, and streaming devices, every corner of the household now depends on a stable Wi-Fi connection. With the average U.S. household running close to **17 connected devices**, the pressure on networks has never been higher.

For service providers and smart home vendors, this shift raises the stakes. A dropped connection in the home office can trigger a support ticket, a dead zone in the bedroom can mean a returned device, and repeated issues can quickly erode customer trust and loyalty. Connectivity isn't

just a technical matter; it is now a **core driver of satisfaction, retention, and revenue**.

The goal of this report is to break down how consumers experience their home connectivity today: the frequency and nature of Wi-Fi problems, how they attempt to resolve them, what they expect from providers, and what would make them stay loyal. By unpacking these experiences and preferences, the survey offers a roadmap for providers to improve reliability, reduce churn, and unlock new opportunities for growth.

Methodology

This report is based on the **TechSee Home Connectivity Survey**, conducted in **August 2025** with a nationwide sample of U.S. consumers. The survey was designed to capture real-world experiences and expectations around home Wi-Fi performance, troubleshooting, and provider interactions.

● Sample size

3,780 respondents, with **3,606** completing all questions

● Population

U.S. adults aged **18-60**

● Sampling

Census-weighted to represent gender, age, household income, and geography

● Margin of error

±1.6% at the **95%** confidence level

● Method

Online panel survey, average completion time **6-7 minutes**

Demographics

● Age distribution

22% aged **18-29**, 26% aged **30-44**, 30% aged **45-60**, 22% over **60**

● Gender

48% male, **52%** female

● Regions

Balanced coverage across all U.S. Census regions (Pacific, Mountain, Middle Atlantic, etc.)

● Income levels

Broad representation across all major U.S. household income brackets

Executive Summary

The findings from the TechSee Home Connectivity Survey paint a clear picture: connectivity gaps remain widespread, frustrating, and costly for providers

● Connectivity issues are common

68% of households reported Wi-Fi problems in the past 12 months. Disruptions are frequent, with **18%** experiencing them daily and another **20%** weekly. Despite the promise of premium services, households with whole-home Wi-Fi packages are not immune - **72%** of them still reported connectivity issues.

● Coverage pain is widespread

76% of consumers who reported connectivity issues experience location-specific gaps in their home. Bedrooms (**35%**) and home offices (**24%**) are the most common weak zones, where poor connectivity directly disrupts productivity, entertainment, and rest.

● DIY is the first instinct

Over half of consumers (**51%**) try to fix problems themselves before calling for support. Yet only **62%** fully resolve the issue without help, highlighting customer frustration.

● The support burden is heavy

Two thirds of households contacted their ISP at least once in the past year due to connectivity issues; nearly **39%** had a technician dispatched. Alarming, about **20%** of those visits failed to resolve the issue, leaving households with recurring connectivity problems.

● Churn is loyalty's shadow

More than half (**51%**) of consumers would switch providers if issues aren't resolved quickly, while **48%** would switch for better whole-home coverage. About one-third (**34%**) are even willing to pay extra, reinforcing that assurance trumps price.

● Customers want proactive service

Three in four expect providers to test coverage during installation and show them that every room is connected. Over half (**56%**) would purchase additional equipment if presented with clear evidence of gaps, creating significant new revenue opportunities for ISPs.

● Visual tools are the new differentiator

Two-thirds (**66%**) would use a visual Wi-Fi mapping app, and **69%** say step-by-step visual guidance would reduce the need to call support. Interest in visual tools was highest among heavy-device households (**16+ devices**), where demand for reliability is greatest.

The message is clear:

Connectivity experience is the new battleground for providers. Customers expect reliability, proof, and proactive service. Those who meet this bar will not only reduce churn but also unlock opportunities to upsell and deepen loyalty.

The Connected Home Landscape

U.S. households are more connected than ever, placing growing pressure on home Wi-Fi networks.

Device load is high

Over half of households report more than six devices connected at any given time, and nearly 40% report more than 11. Device load play a role in connectivity experience: Among homes with 16+ devices, reported Wi-Fi issues were significantly higher (70%) compared to households with 1-5 devices (58%).

Approximately how many devices in your home (phones, laptops, speakers, TVs, etc) are connected to the internet?

Routers are aging

Nearly half of consumers use routers that are **3 years old or more**, with only 18% upgrading within the last year, and 29% in the past two years. As bandwidth demands rise, outdated equipment is increasingly a weak link. Homes with routers ≥ 3 years old were more likely to report connectivity issues (72%) than homes with routers less than 2 years old (60%).

How old is your current Wi-Fi router?

- Less than 1 year
- 1-2 years
- 3-4 years
- 5+ years
- I'm not sure

■ Whole-home Wi-Fi adoption is widespread - but imperfect.

Two-thirds of respondents say they have a whole-home Wi-Fi package that promises coverage everywhere, yet a majority still experience connectivity gaps. Surprisingly, customers that indicated they have the whole home Wi-Fi package suffer more from connectivity issues (72%) vs. those who indicated they don't have such a package (62%). This signals a disconnect between marketing promises and lived experience.

Do you currently have a whole-home Wi-Fi package (promising coverage everywhere)?

● Yes ● No ● I'm not sure

Connectivity Challenges

Despite the promise of whole-home Wi-Fi solutions, most households continue to face persistent issues that disrupt daily life and erode trust in their providers.

■ Issues are widespread

68% of respondents reported experiencing connectivity problems in the past year, with nearly 17.5% facing disruptions at least daily, and 20% at least weekly. Filter callout: Among 18-29 year olds, the share reporting daily problems was 12%, compared with 25% among those aged 45-60.

Have you experienced any gaps or connectivity issues with your home Wi-Fi in the past 12 months?

● Yes

● No

32.28%

67.72%

How often do you experience connectivity issues with your home WiFi?

● At least once a day

41.93%

● A few times a week

17.53%

● A few times a month

19.80%

● Rarely

20.74%

■ The pain points are clear

Consumers report a range of recurring issues: 55% face inconsistent speeds or connection drops, 50% struggle with slow speeds, 31% experience dead zones with no coverage, and 25% see their smart devices disconnect. Homes with routers ≥ 3 years old were significantly more likely to report connectivity issues (68%) than those with routers ≤ 1 year old (45%). Together, these findings highlight the limits of current home Wi-Fi solutions in supporting multiple devices and high-bandwidth applications simultaneously.

Which of the following Wi-Fi issues have you experienced in the past 12 months? (Select all that apply)

■ Problems are room-specific

76% of consumers who reported connectivity issues experience coverage gaps. Bedrooms (**35%**) and home offices (**24%**) are the areas most likely to suffer weak or unreliable Wi-Fi; spaces where connectivity failures most directly impact productivity, entertainment, and rest.

Where in your home do you have the weakest or most unreliable Wi-Fi connection?
(Select all that apply)

Consumer Response & Troubleshooting

When Wi-Fi fails, most customers don't reach for the phone first, they try to fix it themselves. Over half of respondents (51%) said their first instinct is to troubleshoot on their own, while only one in five immediately contact their service provider.

The most common solutions are familiar: nearly eight in ten consumers restart their router (80%), a third (32%) reposition the router or nearby objects that could interfere with the signal, and more than a quarter (27%) invest in extenders or upgraded Wi-Fi packages. Others turn to their provider directly through phone or chat support, and a smaller group, around 7%, ultimately schedule a technician visit. These efforts show both persistence and frustration, as households invest time, money, and energy into fixes that often address symptoms rather than the root cause.

If/when you experience connectivity issues, what do you usually do first?

Which of the following have you tried to fix internet connectivity issues in your home? (Select all that apply)

Despite these attempts, success is mixed. About 62% say they can fully resolve problems on their own, one-third achieve only partial relief, and 5% admit they usually need outside help. Younger consumers aged 18–29 are less successful, with only 48% able to resolve issues completely on their own, compared with 71% among those aged 45–60.

Are you typically able to fully fix internet connectivity issues on your own?

- Yes, completely
- Partially
- No, I usually need help

ISP Support Experience

Frequency of ISP Contacts

Even after trying to troubleshoot on their own, many households still turn to their internet service provider (ISP) for help. In the past 12 months, 33% of households never contacted their ISP for Wi-Fi issues. But that leaves two-thirds who did: 21% contacted their provider once, while 35% reached out two or more times. A notable 8% said they contacted their ISP four to five times, and 3% reported six or more contacts in a single year.

How many times in the last year did you contact your ISP for Wi-Fi issues?

Technician Dispatch and Resolution

These calls often escalated to in-home visits. Nearly 39% of households reported that a technician was dispatched to their home at least once in the past two years. In most cases, the visit resolved the problem - 31% said the issue was fixed after the first visit. However 8%, about a fifth of those who experienced a technician visit reported that it did not resolve their issue..

In the past two years, has a technician ever been sent to your home for Wi-Fi issues, and was the issue resolved?

Switching & Loyalty

The survey highlights just how strongly the quality of connectivity shapes consumer loyalty. Customers are willing to give providers a chance, but when problems persist, patience runs thin. Providers who fail to resolve connectivity issues quickly or demonstrate coverage risk losing customers to competitors that do.

Resolution speed drives retention

51% of consumers say they would consider switching providers if their connectivity issues were not resolved quickly, while only 11% disagreed.

Coverage is non-negotiable

48% would switch to another ISP if a competitor offered better whole-home coverage with no weak spots, while only 10% disagreed.

Price is not the lever many expect

34% said they would even pay up to 10% more for more reliable connectivity, while 45% disagreed. This shows that reliability and trust carry more weight than price elasticity.

I would consider switching internet providers if the new provider offered better connectivity across my entire home (no WiFi weak/dead zones).

I would consider switching providers if connectivity issues were not resolved quickly.

I would switch providers for better connectivity even for a fee or more expensive package up to 10%.

Expectations for Proactive Service

The survey makes it clear that customers don't just want problems fixed when they arise, they expect their providers to anticipate and prevent them.

Trust is built through proactivity

73% said they would trust their provider more if it proactively helped them fix Wi-Fi issues, while only 9% disagreed.

Expectations during setup are high

76% expect providers to flag coverage gaps during installation, and 77% expect technicians to test and demonstrate that the entire home is connected before leaving their home.

Openness to upsell exists

If it's evidence-based. 56% of respondents said they would consider purchasing additional equipment, such as extenders or mesh routers, if the technician could clearly show where coverage gaps existed and explain how upgrades would help.

If I purchased a whole-home WiFi package and part of my home didn't have a strong connection, I would expect a fix within 3-5 business days.

If after a technician installed my whole-home WiFi I later discovered a weak connection in my home, I would consider switching providers.

I would trust a provider more if they helped me fix Wi-Fi issues proactively.

During installation or setup, I expect my provider to inform me of any WiFi coverage gaps.

Visual Solutions: Making Connectivity Visible

Connectivity issues are often invisible to the customer. A weak signal in one room may feel like a mysterious glitch, leaving households unsure of the cause and frustrated by trial-and-error fixes. The survey reveals a clear desire for visual tools that make Wi-Fi problems easier to understand and resolve.

Seeing the problem

66% of consumers said they would use a mobile app that visually maps their home's Wi-Fi coverage and interference.

Guided to resolution

69% agreed that step-by-step visual instructions would help them avoid calling support. This preference reflects a broader shift in consumer behavior: customers don't just want to be told what to do - they want to see how to do it.

Interest in visual tools was highest among **heavy-device households (16+ devices)**, where demand for reliable connectivity is greatest. These homes were more likely to express interest in visual apps (79%) compared with households with only 1-5 devices (54%).

Conclusion

The 2025 Home Connectivity Survey makes one thing clear: **connectivity experience is the new battleground.**

Nearly seven in ten households report Wi-Fi issues, many of them in the most critical areas of daily life: bedrooms, home offices, and smart-device hubs. Most consumers start by troubleshooting themselves, yet a third can only partially resolve their issues, and many still turn to their ISP multiple times per year. Even after technician visits, almost one in ten remain dissatisfied. Every one of these unresolved cases represents not just a poor experience, but an increased cost-to-serve and an elevated risk of churn.

Customers are telling providers what they want: faster resolution, proactive assurance, and transparency. More than half would switch providers over poor connectivity, while three-quarters expect coverage gaps to be identified and demonstrated during installation.

At the same time, consumers are open to solutions - 56% would purchase additional equipment if shown visual proof of gaps, and two-thirds want tools that let them see and manage their Wi-Fi themselves.

The takeaway is clear: speed and price are no longer enough. Loyalty and growth will be won by those who deliver visible, reliable, and proactive connectivity experiences. Providers that embrace visual diagnostics, guided self-service, and transparent coverage assurance will not only reduce churn and cut support costs, they will unlock new revenue streams and stronger customer relationships in the connected home.
